From the app's simple interface you can set the starting and ending frames of the segment you want to cut from the video, as well as the selected output format. It is quite likely that at some point, you might have found yourself in need of a dedicated tool for splitting your video files. Although complex software suites come with such a capability as a staple feature these days, getting around to working with them can sometimes be challenging, especially for beginners. With simplicity in mind and ergonomic handling, My Video Cutter will allow users to easily add and cut their video files to the preferred duration. Add your video file, select the required duration segment and choose a preferred output format. Users can add their files using the dedicated function, but no drag-and-drop functionality is offered. A dual-screen preview provides a good overview of the starting and ending video frames, making for an easy selection. Setting the duration can either be done using the numerical inputs, as well as by simply dragging the sliders to the required position. A range of some of the most common video formats is offered as output, this way making the app a converter as well. Lack of batch processing and no multi-segment selection could deter more demanding users. When it comes to the caveats of the provided package, these aren't so many, most being more important if you need to process multiple videos or need to fine-tune the segment selection even more. No batch processing is present, meaning that you will have to edit each video at a time, and there is no ability to select multiple segments for cutting, which could be of interest to those who crave a bit more extra capability. Minimalist video cutter app that puts emphasis on simplicity and ease-of-use, but lacks more advanced features. If you seek a basic video cutter that allows you to add your file, select the preferred duration, an output format and proceed with the splitting, all in a simple manner, then this application could be for you.
