Various formats from 240p to 720p HD (or even 1080p). HTML5 available for mobile devices. Prevalence of epidermal growth factor receptor mutations in the first-line treatment of advanced non-small cell lung cancer in western Europe. The epidermal growth factor receptor (EGFR) mutation status of non-small cell lung cancer (NSCLC) patients treated with first-line EGFR tyrosine kinase inhibitors (TKI) varies greatly across different countries. We aim to evaluate the EGFR

mutation rate in the first-line advanced NSCLC population treated in Europe. We performed a retrospective, multicentric, observational study of 673 patients with newly diagnosed advanced NSCLC treated with first-line TKI (n = 198 gefitinib, n = 395 erlotinib). EGFR mutation was defined according to the international guidelines. A total of 137 patients (20.1%) had an EGFR mutation. Of these, only 65.1% were Asian (mainly Chinese), and 10.3% were of the known activating EGFR mutation subtypes (exon 19 deletions, L858R). There were significant differences in median age ( $P < 0.0001$ )
